

# Truck and hazardous goods data

## Sound basis for cost effective transports

Too heavy, too high, too wide? Route planning for trucks creates several challenges. For more than 15 years map&guide has been specialising in the transport industry and helping to avoid unnecessary delays, detours, risks and the incurring costs.

Truck routing

THE perfect route is different for everyone. A good guide is provided by the standard vehicle profiles for different truck types saved in the software. When using these map&guide will show suitable routes for truck transportation for route calculations from the start. However you can also create your own vehicle profile for each truck. This enables you to define which roads are preferred, avoided or banned. By adjusting the priority of road types, low-emission zones can be completely avoided or heavy goods transports can be routed via motorways.

The map will show you at a glance where map&guide has truck and dangerous goods data available.

### Integrated truck and dangerous goods data for Europe

map&guide guides you safely through Europe. More than 10 different truck attributes are stored in the product. If required, these are shown on the map and included in the route calculation. For example they include maximum length, width, height, or axle load, as well as blocked roads and time restriction blocks and road blocks for hazardous goods. Warnings such as steep inclines are shown on the map and in the itinerary for your safety.

### Individual road blocks

Use the Road Editor to change individual road closures on the map, closing or opening individual roads. This enables you to open factory gates for example or field and woodland roads which are blocked for other road users.

In the whole of Europe. Our data coverage.
