

# map&guide professional 2011

## Route planning software for transporters

map&guide professional is Europe's leading transport route planner, with features and data tailored specifically for the transport industry. This software comes with all the features and performance you need when dispatching transports every day:

- **Truck-optimised route planning** with truck routing (based on vehicle type) and integrated truck and hazardous goods data for Europe
- **Precise distance calculation** based on map&guide kilometres that are recognized as a standard
- **Calculation of exact transport costs** including vehicle costs, diesel consumption, toll, future toll scenarios, special toll and LSWA
- **TÜV validated emission calculation** and integrated CO2 offset programme – to support your green logistics services
- **Sequence and time slot optimisation** of trips
- **Consideration of driving times and rest periods** even for two-driver crews
- **Visualisation and classification of customer data** on the map to visually represent your customer structure, and much more

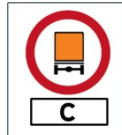

### New in the 2011 version

#### Account for future toll payments

With map&guide professional 2011 toll calculation is even more exact. You will always receive the current or forecasted charges valid on the trip's specified departure date. Even in the event that toll rates are increased, new toll roads are introduced or new toll systems for Europe are discussed (including any draft bills put forward), this information is immediately made available to you through our updates. Have today's calculations account for the toll fees charged from mid-2011 on German trunk roads, the Eco tax levied in France in 2013, the future truck toll in Poland or the toll increase in the Czech Republic in 2012.

With our calc+ add-on module you can also create a detailed cost comparison: How much are the toll charges for my trips today and will they change in 6 months? The toll charges can also be individually defined for each country separately.

#### Tunnel restriction codes

The tunnel restriction codes regulate which hazardous goods may be transported through tunnels. This information is also stored in map&guide professional. You will receive a message during route calculation, if a tunnel which is blocked for hazardous goods is on your route. You can directly calculate an alternative route and if necessary block the tunnel for your transports

#### Two monitor view

Use map&guide professional on two monitors at the same time. For example the monitor on the left can be used for the menus and list of stop-off points while the monitor on the right is completely reserved for the map.

#### Your feedback

Since we have included a feedback button we have been able to include lots of your suggestions for improvement and ideas into the development of every new version. Carry on helping us!

Did you know that an exact description on using the feedback button is available on our YouTube channel?
